AB The invention relates to an optical recording medium which has a substrate
and, formed thereon, a recording layer contg. at least two types of dye,
i.e., a dye A and a dye B, characterized in that the above dye A and the
above dye B satisfy the following requirements (1) and (2): (1) they have
a decompn. starting temp. of 150 to 250.degree.C, (2) a refractive index
n(A) and an exhaustion coeff. k(A) of the dye (A) at the wavelength of a
laser radiation light for recording, and a refractive index n(B) and an
exhaustion coeff. k(B) of the dye (B) at the above wavelength satisfy the
following formulas: $n(B) / n(A) > 0.7$ $k(B) / k(A) > 10$. The dye shows
high sensitivity in high and low speed recording modes.

AB The invention relates to an optical recording medium which has a substrate and, formed thereon, a recording layer contg. at least two types of dye, i.e., a dye A and a dye B, characterized in that the above dye A and the

above dye B satisfy the following requirements (1) and (2): (1) they have a decompn. starting temp. of 150 to 250.degree.C, (2) a refractive index n(A) and an exhaustion coeff. k(A) of the dye (A) at the wavelength of a laser radiation light for recording, and a refractive index n(B) and an exhaustion coeff. k(B) of the dye (B) at the above wavelength satisfy the following formulas: $n(B) / n(A) > 0.7$ $k(B) / k(A) > 10$. The dye shows high sensitivity in high and low speed recording modes.

AB The invention relates to an optical recording medium which has a substrate and, formed thereon, a recording layer contg. at least two types of dye, i.e., a dye A and a dye B, characterized in that the above dye A and the above dye B satisfy the following requirements (1) and (2): (1) they have a decompn. starting temp. of 150 to 250.degree.C, (2) a refractive index $n(A)$ and an exhaustion coeff. $k(A)$ of the dye (A) at the wavelength of a laser radiation light for recording, and a refractive index $n(B)$ and an exhaustion coeff. $k(B)$ of the dye (B) at the above wavelength satisfy the following formulas: $n(B) / n(A) > 0.7$ $k(B) / k(A) > 10$. The dye shows high sensitivity in high and low speed recording modes.

AB Provide is an optical disk which has an image recording layer, wherein a visible image can be recorded by using laser beams and by which a visible image having excellent visibility can be recorded in the image recording layer. An optical disk is provided with a board having a groove, and an image recording layer formed on the board for recording a visible image by laser beam irradiation. The optical disk is characterized in that the image recording layer has a reflectance of 7-45% at a wavelength of 660nm before recording, 35% or less at a wavelength of 500nm, a reflectance at a wavelength of 660nm after recording reduces 50% or more compared with that before recording, and the reflectance change of a wavelength where the reflectance increase is max. within a wavelength range of 450-550nm increases 30% or more compared with the reflectance before recording.

- AB Bis(1,3-dioxolane-4,6-diones), useful for heat-mode optical disks for recording/readout by lasers, are I (Ma1-Ma3 = (substituted) methine; Za2, Za3 = at. group forming acidic nucleus; R1 = substituent; R3 = H, substituent; Y = divalent linkage without forming .pi. conjugated system with linkages to Za2 and Za3; n = 0-3; p = 0-5). Thus, cyclohexane-1,4-dione was condensed with malonic acid to give cyclohexylenebis(1,3-dioxolane-4,6-dione) II, which was treated with PhN:CHCH:CHCH:CHNHPH HCl salt, treated with 2-methyl-2-propyl-1,3-dioxolane-4,6-dione (manufd. from malonic acid and 2-pentanone) in the presence of NEt3, and neutralized with HCl to give III.

* STRUCTURE DIAGRAM TOO LARGE FOR DISPLAY - AVAILABLE VIA OFFLINE PRINT *

AB Oxonol salts I [Za1 = at. group necessary for forming acidic nucleus; Ma1-Ma3 = (substituted) methine; Q = cation; m = 0-3; y = no. necessary for neutralizing elec. charge] are manufd. by treatment of R1pC6H5-pN(:Ma1Ma2:)mMa3NR3C6H5-qR2q (Ma1-Ma3, m = same as I; R1, R2 = substituent; R3 = H, substituent; p, q = 0-5) with cyclic ketones II (Za1 = same as I; L1 = H, leaving group) in the presence of bases from -30.degree. to 10.degree.. Other oxonol salts III [Za1, Za2 = at. group necessary for forming acidic nucleus; Ma4-Ma6 = (substituted) methine; Q = cation; n = 0-3; y = same as I] and IV [Za2-Za4 = at. group necessary for forming acidic nucleus; Ma4-Ma6 = (substituted) methine; Y = bivalent linkage without forming .pi.-conjugated system; Q = cation; n = 0-3; y = same as I] are manufd. by a similar process, resp. The dyes, useful for lase-sensitive heat-mode WORM disks, are manufd. by cation exchange of I, III, or IV with quaternary ammonium salts via A-(N+R6R7R8R9)s (A = oxonol residue from I, III, or IV; R6-R9 = alkyl, aryl; s = 1, 2). Thus, PhN(:CHCH:)3CHNPh.HCl was treated with 2,4-dioxo-1,5-dioxaspiroundecane in the presence of NET3 at -10.degree., and treated with N,N'-bis(3-phenyl-4-hydroxyphenyl)-4,4'-bipyridinium dichloride to give V.

AB The invention relates to an optical recording medium which has a substrate and, formed thereon, a recording layer contg. at least two types of dye, i.e., a dye A and a dye B, characterized in that the above dye A and the above dye B satisfy the following requirements (1) and (2): (1) they have a decompn. starting temp. of 150 to 250.degree.C, (2) a refractive index n(A) and an exhaustion coeff. k(A) of the dye (A) at the wavelength of a laser radiation light for recording, and a refractive index n(B) and an exhaustion coeff. k(B) of the dye (B) at the above wavelength satisfy the following formulas: $n(B) / n(A) > 0.7$ $k(B) / k(A) > 10$. The dye shows high sensitivity in high and low speed recording modes.

AB The invention relates to an optical recording medium which has a substrate and, formed thereon, a recording layer contg. at least two types of dye, i.e., a dye A and a dye B, characterized in that the above dye A and the above dye B satisfy the following requirements (1) and (2): (1) they have a decompn. starting temp. of 150 to 250.degree.C, (2) a refractive index

n(A) and an exhaustion coeff. k(A) of the dye (A) at the wavelength of a laser radiation light for recording, and a refractive index n(B) and an exhaustion coeff. k(B) of the dye (B) at the above wavelength satisfy the following formulas: $n(B) / n(A) > 0.7$ $k(B) / k(A) > 10$. The dye shows high sensitivity in high and low speed recording modes.

AB	The invention relates to an optical recording medium which has a substrate and, formed thereon, a recording layer contg. at least two types of dye, i.e., a dye A and a dye B, characterized in that the above dye A and the above dye B satisfy the following requirements (1) and (2): (1) they have a decompn. starting temp. of 150 to 250.degree.C, (2) a refractive index n(A) and an exhaustion coeff. k(A) of the dye (A) at the wavelength of a laser radiation light for recording, and a refractive index n(B) and an exhaustion coeff. k(B) of the dye (B) at the above wavelength satisfy the following formulas: $n(B) / n(A) > 0.7$ $k(B) / k(A) > 10$. The dye shows high sensitivity in high and low speed recording modes.

AB The invention relates to a novel oxonol compd. represented by the formula (I) and a process producing the compd. thereof, which comprises reacting the compd. represented by the formula (II) with the compd. represented by the formula (III) defined herein.: wherein R1 and R2 each independently represent H, a substituted or unsubstituted C1-10 alkyl, or a substituted or unsubstituted C6-10 aryl; R3 , R4 , R6, and R7 each independently represent H or a substituted or unsubstituted C1-10 alkyl; R5 represents H, halo, a substituted or unsubstituted C1-10 alkyl, a substituted or unsubstituted C6-10 aryl, a substituted or unsubstituted C2-10 acylamino,, or a substituted or unsubstituted C1-6 heterocyclic; R8 represents H or a substituted or unsubstituted C2-10 acyl; and R9-R18 each independently represent H or a substituent; provided that R1 and R2 may be bonded to each other to form a ring. The oxonol compd. is useful as an intermediate for an oxonol dye for use in heat mode type information-recording media in which information is recorded with a visible laser light, which are represented by recordable digital versatile disks (DVD-R's).

AB The invention relates to an optical recording medium which has a substrate
and, formed thereon, a recording layer contg. at least two types of dye,
i.e., a dye A and a dye B, characterized in that the above dye A and the
above dye B satisfy the following requirements (1) and (2): (1) they have
a decompn. starting temp. of 150 to 250.degree.C, (2) a refractive index
n(A) and an exhaustion coeff. k(A) of the dye (A) at the wavelength of a
laser radiation light for recording, and a refractive index n(B) and an
exhaustion coeff. k(B) of the dye (B) at the above wavelength satisfy the
following formulas: $n(B) / n(A) > 0.7$ $k(B) / k(A) > 10$. The dye shows
high sensitivity in high and low speed recording modes.

AB	The invention relates to an optical recording medium which has a substrate and, formed thereon, a recording layer contg. at least two types of dye, i.e., a dye A and a dye B, characterized in that the above dye A and the above dye B satisfy the following requirements (1) and (2): (1) they have a decompn. starting temp. of 150 to 250.degree.C, (2) a refractive index n(A) and an exhaustion coeff. k(A) of the dye (A) at the wavelength of a laser radiation light for recording, and a refractive index n(B) and an exhaustion coeff. k(B) of the dye (B) at the above wavelength satisfy the following formulas: $n(B) / n(A) > 0.7$ $k(B) / k(A) > 10$. The dye shows high sensitivity in high and low speed recording modes.

AB The invention relates to a novel oxonol compd. represented by the formula (I) and a process producing the compd. thereof, which comprises reacting the compd. represented by the formula (II) with the compd. represented by the formula (III) defined herein.: wherein R1 and R2 each independently represent H, a substituted or unsubstituted C1-10 alkyl, or a substituted or unsubstituted C6-10 aryl; R3 , R4 , R6, and R7 each independently represent H or a substituted or unsubstituted C1-10 alkyl; R5 represents H, halo, a substituted or unsubstituted C1-10 alkyl, a substituted or unsubstituted C6-10 aryl, a substituted or unsubstituted C2-10 acylamino,, or a substituted or unsubstituted C1-6 heterocyclic; R8 represents H or a substituted or unsubstituted C2-10 acyl; and R9-R18 each independently represent H or a substituent; provided that R1 and R2 may be bonded to each other to form a ring. The oxonol compd. is useful as an intermediate for an oxonol dye for use in heat mode type information-recording media in which information is recorded with a visible laser light, which are represented by recordable digital versatile disks (DVD-R's).

AB	The invention relates to an optical recording medium which has a substrate and, formed thereon, a recording layer contg. at least two types of dye, i.e., a dye A and a dye B, characterized in that the above dye A and the above dye B satisfy the following requirements (1) and (2): (1) they have a decompn. starting temp. of 150 to 250.degree.C, (2) a refractive index n(A) and an exhaustion coeff. k(A) of the dye (A) at the wavelength of a laser radiation light for recording, and a refractive index n(B) and an exhaustion coeff. k(B) of the dye (B) at the above wavelength satisfy the following formulas: $n(B) / n(A) > 0.7$ $k(B) / k(A) > 10$. The dye shows high sensitivity in high and low speed recording modes.

AB The influence of native, hydrophobic and ***dimeric*** forms of RNases (RNase A and RNase Bacillus intermedius) on the process of phagocytosis and fusion between lysosomes and phagosomes in rat macrophages has been studied. The effect of native RNases depends on their concn.: comparatively low concns. (0.5 - 50 .mu.g ml-1) stimulate the phagocytosis and phagosome-lysosome fusion whereas high concns. (above 75 .mu.g ml-1) inhibit these processes. RNases modified by surfactant ***oxanol*** -KD-6 and ***dimeric*** forms of RNases possess only the inhibitory effect, which appears at concn. considerably lower than that of native enzymes. The stimulatory effect of native RNases and the inhibitory effect of hydrophobic derivs. do not depend on the catalytic activity.

AB A simple and efficient prepn. of I (R = alkyl, aryl, heterocyclic group; Q, X = CN, carboxy ester, carboxamide, sulfoxyl, sulfonyl, sulfonamide, or QX = 4-7-membered heterocycle) comprises reacting the corresponding ketomethylene compd. or malononitrile with an isothiocyanate in the presence of a base, reacting the resulting product with a haloacetic acid or haloacetic ester, followed by eliminating water or alc. to form the 1,3-thiazolidin-4-one ring. The method includes appending a fragment necessary to complete a merocyanine, ***oxonol***, hemicyanine, benzyldiene, cinnamylidene, or holopolar cyanine dye, to the 5-position of the 1,3-thiazolidin-4-one ring. Thus, N-(methoxycarbonylmethyl)rhodanine was condensed with ethoxycarbonylmethyl isothiocyanate followed by Et bromoacetate to give a thiazolidine ***dimer*** deriv. This compd. was then treated with 2-(.beta.-acetanilidovinyl)-3-(3-sulfopropyl)benzothiazolium hydroxide and Et3N to provide a cyanine dye.

CC 9-0 (Biochemical Methods)
AB A review with 206 refs. Basic tenets related to the use of three main classes of potentiometric redistribution fluorescent dyes (carbocyanines, ***oxonols***, and rhodamines) are discussed in detail. They include the structure/function relationship, formation of nonfluorescent (H-type) and fluorescent (J-type) ***dimers*** and higher aggregates, probe partitioning between membranes and medium and binding to membranes and intracellular components (with attendant changes in absorption and emission spectra, fluorescence quantum yield and lifetime). The crucial importance of suitable probe-to-cell concn. ratio and selection of optimum monitored fluorescence wavelength is illustrated in schematic diagrams and possible artifacts or puzzling results stemming from faulty exptl. protocol are pointed out. Special attention is paid to procedures used for probe-response calibration (potential clamping by potassium in the presence of valinomycin, use of gramicidin D in combination with N-methylglucamine, activation of Ca-dependent K-channels by A23187, the null-point technique). Among other problems treated are dye toxicity, interaction with mitochondria and other organelles, and possible effects of intracellular pH and the quantity of cytosolic proteins and/or RNA on probe response. Individual techniques using redistribution dyes (fluorescence measurements in cuvettes, flow cytometry and microfluorimetry of individual cells including fluorescence confocal microscopy) are discussed in terms of reliability, limitations and drawbacks, and selection of suitable probes. Up-to-date examples of application of slow dyes illustrate the broad range of problems in which these probes can be used.

CC 6-13 (General Biochemistry)

AB There are 2 basically different mechanisms for the fluorescence and
absorption changes of merocyanine, cyanine, and ***oxonol*** dyes.
The permeant dyes (cyanine and ***oxonol*** dyes, with delocalized
charges) work by a potential-dependent accumulation mechanism. These dyes
show large (.ltoreq.80%) fluorescence and absorption changes with
suspensions of cells; the changes are complete in seconds. The impermeant
dyes (merocyanine dyes, with localized charges) and the permeant dyes also
show optical changes that take place in fractions of msec. The rapid
optical changes are relatively small (.ltoreq.5 .times. 10-3) but can
often be easily detected in expts. with single cells. The rapid,
nonaccumulative, optical changes result from membrane-localized dye
movements. Cyanine dye-absorption changes occur because of a
potential-dependent partition of dye between the membrane and the adjacent
aq. region at the high dye-concn. side of the membrane. ***Dimers***

and larger aggregates are formed in the aq. region during the change. Merocyanine dyes may also work by the same mechanism. DiS-C3-(5) is presently the best dye for measuring membrane potentials of cells, organelles, and vesicles in suspension, but several other cyanines work nearly as well (P. J. Sims, A. S. Wagoner, C.-H. Wang, J. F. Hoffman, 1974). For each system, the ratio of dye to membrane must be varied until the optimum fluorescence change is found. A sep. calibration curve must be obtained for each system. For measuring fluorescence and (or) absorption changes in single cells, merocyanine 540 and diBA-C4-(5) work well but produce some photodynamic damage with high-intensity illumination. A rhodanine merocyanine (WW-375) gives very large absorption changes and does not damage tissue during strong illumination. As the mechanisms of the optical changes are worked out, it should be possible to design and synthesize more sensitive, less toxic dyes that are easier to calibrate and thus may be useful for studying the structure and dynamics of excitable membranes.

AB	Provide is an optical disk which has an image recording layer, wherein a visible image can be recorded by using laser beams and by which a visible image having excellent visibility can be recorded in the image recording layer. An optical disk is provided with a board having a groove, and an	

image recording layer formed on the board for recording a visible image by laser beam irradsn. The optical disk is characterized in that the image recording layer has a reflectance of 7-45% at a wavelength of 660nm before recording, 35% or less at a wavelength of 500nm, a reflectance at a wavelength of 660nm after recording reduces 50% or more compared with that before recording, and the reflectance change of a wavelength where the reflectance increase is max. within a wavelength range of 450-550nm increases 30% or more compared with the reflectance before recording.

AB Bis(1,3-dioxolane-4,6-diones), useful for heat-mode optical disks for recording/readout by lasers, are I (Ma1-Ma3 = (substituted) methine; Za2, Za3 = at. group forming acidic nucleus; R1 = substituent; R3 = H, substituent; Y = divalent linkage without forming .pi. conjugated system with linkages to Za2 and Za3; n = 0-3; p = 0-5). Thus, cyclohexane-1,4-dione was condensed with malonic acid to give cyclohexylenebis(1,3-dioxolane-4,6-dione) II, which was treated with PhN:CHCH:CHCH:CHNHPH HCl salt, treated with 2-methyl-2-propyl-1,3-dioxolane-4,6-dione (manufd. from malonic acid and 2-pentanone) in the presence of NEt3, and neutralized with HCl to give III.

AB The invention relates to an optical recording medium which has a substrate and, formed thereon, a recording layer contg. at least two types of dye, i.e., a dye A and a dye B, characterized in that the above dye A and the above dye B satisfy the following requirements (1) and (2): (1) they have a decompn. starting temp. of 150 to 250.degree.C, (2) a refractive index n(A) and an exhaustion coeff. k(A) of the dye (A) at the wavelength of a laser radiation light for recording, and a refractive index n(B) and an exhaustion coeff. k(B) of the dye (B) at the above wavelength satisfy the following formulas: n(B) / n(A) > 0.7 k(B) / k(A) > 10. The dye shows high sensitivity in high and low speed recording modes.
